

The Oilenco Fishing Claw was designed by our engineers as a versatile and robust tool for fishing a variety of difficult downhole targets.

## How It Works?

A single large die spring is charged with snapping the three jaws shut, triggered by the fish striking the central trigger button. Once an object has been grabbed, the claw's grip will tighten as the pulling force increases.

*"The claw's grip tightens as the pulling force increases".*

The tool can be quickly reset and re-run with no redress, disassembly or shearing elements required. The protrusion of the trigger button can be adjusted, as can the spring force to best suit your fishing scenario.

## Features and Benefits

- No redress, disassembly or shearing elements required between each use.
- The claw's grip tightens as the pulling force increases.
- Adjustable trigger button to suit various fishing scenarios.
- An alternative to the alligator grab fishing tools

## Alternative Options

Recognising the different applications and scenarios that require a fishing claw, Oilenco can design and manufacture bespoke claw cores and claw jaws for your specific needs.
