

SCALE REMEDIAL PACKAGE

Soak Sleeve and Syringe

oilenco

Tredwell

The Soak Sleeve and Syringe provides a means of precisely spotting a concentrated chemical solution across a downhole safety valve. Initially, the Soak Sleeve is deployed across the downhole safety valve, creating a sealed annulus between the sleeve and safety valve. The syringe is then filled with the relevant chemical and deployed into the soak sleeve. The chemical is then expelled into the annulus and left to soak across the affected areas of the safety valve. Leaving the sleeve in place, additional syringe runs can be completed with fresh chemicals as required.

A one-run syringe system is available for subsea operations.

Features and Benefit

- Restores functionality of the downhole safety valve
- Significant time and cost savings
- Deployed on slickline
- Field re-dressable
- Simple installation and operation
